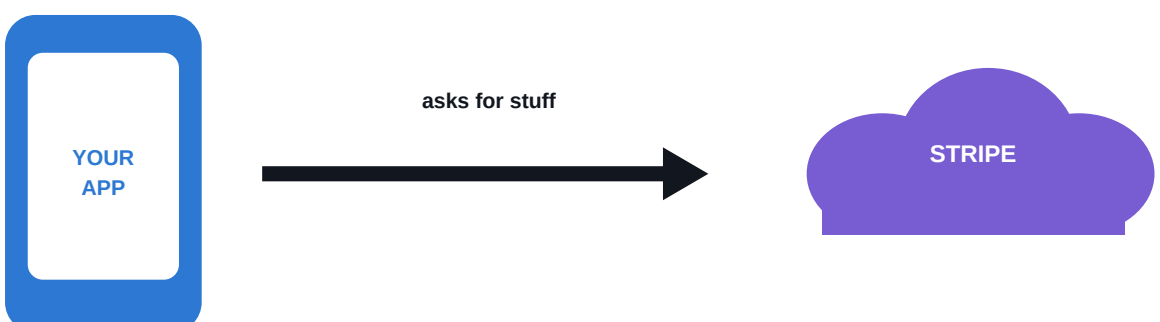
# KeelCat

We keep your code working when APIs change.

# Your app talks to other apps.



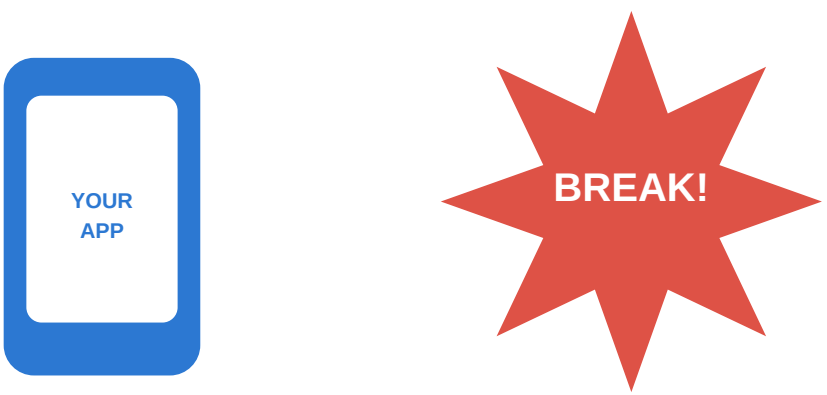
Like asking a friend for help. Your app asks Stripe to take a payment.

# Sometimes the other app changes its rules.

**"Don't say 'source' anymore.**
**Say 'payment_method' now!"**

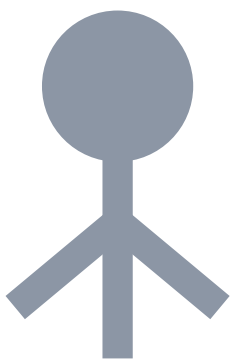
They rename things. They remove things. They don't call you.

# Now your app breaks.



It's still using the old rule. So it stops working - often in front of customers.

# Fixing it by hand is slow and boring.



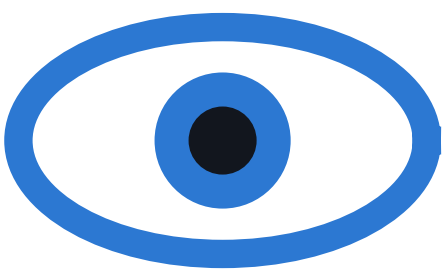
**Zzz... so many files**

An engineer must hunt down every place that uses the old rule, in every project.

# Meet KeelCat.

A little robot cat that does the boring fixing for you.

# 1. It watches for changes.



KeelCat reads the rule book (the changelog) so you don't have to.

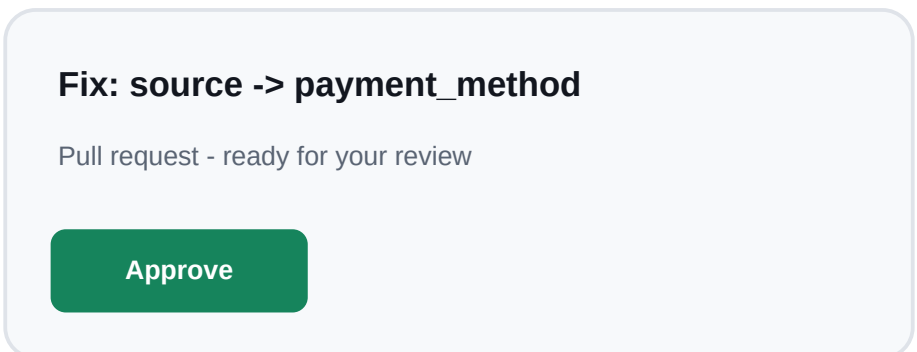
# 2. It fixes your code.

It changes the old rule to the new rule everywhere, in every language.

# 3. It checks the fix works.

KeelCat tries the fix safely first, so it doesn't hand you something broken.

# 4. It asks: 'Okay to use this fix?'



You are always the boss. KeelCat never changes anything without your yes.

# You click yes. Done.

**What used to take hours now takes about a minute.**

# KeelCat

**Your APIs change.  Your code keeps up.**
